AMENDMENT HISTORY

This document shall be amended by releasing a new edition of the document in its entirety. The Amendment Record Sheet below records the history and issue status of this document.

Table 1. Amendment Record Sheet

| ISSUE | DATE | REASON |
|-------|------------|---------------------------|
| 0.1 | dd/mm/yyyy | Initial in-progress draft |

Chapter 1. Introduction

1.1. Purpose and Scope

This document presents the User Profile Design for the Common Architecture.

1.2. Structure of the Document

Section 2 - **Overview**

Provides an over of the User Profile component, within the context of the wider Common Architecture design.

Section 3 - **Building Block Design**

Provides the design of the User Profile component.

1.3. Reference Documents

The following is a list of Reference Documents with a direct bearing on the content of this document.

| Reference | Document Details | Version |

1.4. Terminology

The following terms are used in the Master System Design.

| Term | Meaning |
|-----------------|--|
| Admin | User with administrative capability on the EP |
| Algorithm | A self-contained set of operations to be performed, typically to achieve a desired data manipulation. The algorithm must be implemented (codified) for deployment and execution on the platform. |
| Analysis Result | The <i>Products</i> produced as output of an <i>Interactive Application</i> analysis session. |

| Term | Meaning |
|---|--|
| Analytics | A set of activities aimed to discover, interpret and communicate meaningful patterns within the data. Analytics considered here are performed manually (or in a semi-automatic way) on-line with the aid of <i>Interactive Applications</i> . |
| Application Artefact | The 'software' component that provides the execution unit of the <i>Application Package</i> . |
| Application Deployment and Execution Service (ADES) | WPS-T (REST/JSON) service that incorporates the Docker execution engine, and is responsible for the execution of the processing service (as a WPS request) within the 'target' Exploitation Platform. |
| Application Descriptor | A file that provides the metadata part of the <i>Application Package</i> . Provides all the metadata required to accommodate the processor within the WPS service and make it available for execution. |
| Application Package | A platform independent and self-contained representation of a software item, providing executable, metadata and dependencies such that it can be deployed to and executed within an Exploitation Platform. Comprises the <i>Application Descriptor</i> and the <i>Application Artefact</i> . |
| Bulk Processing | Execution of a <i>Processing Service</i> on large amounts of data specified by AOI and TOI. |
| Code | The codification of an algorithm performed with a given programming language - compiled to Software or directly executed (interpreted) within the platform. |
| Compute Platform | The Platform on which execution occurs (this may differ from the Host or Home platform where federated processing is happening) |
| Consumer | User accessing existing services/products within the EP. Consumers may be scientific/research or commercial, and may or may not be experts of the domain |
| Data Access Library | An abstraction of the interface to the data layer of the resource tier. The library provides bindings for common languages (including python, Javascript) and presents a common object model to the code. |
| Development | The act of building new products/services/applications to be exposed within the platform and made available for users to conduct exploitation activities. Development may be performed inside or outside of the platform. If performed outside, an integration activity will be required to accommodate the developed service so that it is exposed within the platform. |
| Discovery | User finds products/services of interest to them based upon search criteria. |
| Execution | The act to start a <i>Processing Service</i> or an <i>Interactive Application</i> . |

| Term | Meaning |
|------------------------------------|--|
| Execution Management Service (EMS) | The EMS is responsible for the orchestration of workflows, including the possibility of steps running on other (remote) platforms, and the on-demand deployment of processors to local/remote ADES as required. |
| Expert | User developing and integrating added-value to the EP (Scientific Researcher or Service Developer) |
| Exploitation Tier | The Exploitation Tier represents the end-users who exploit the services of the platform to perform analysis, or using high-level applications built-in on top of the platform's services |
| External Application | An application or script that is developed and executed outside of the Exploitation Platform, but is able to use the data/services of the EP via a programmatic interface (API). |
| Guest | An unregistered User or an unauthenticated Consumer with limited access to the EP's services |
| Home Platform | The Platform on which a User is based or from which an action was initiated by a User |
| Host Platform | The Platform through which a Resource has been published |
| Identity Provider (IdP) | The source for validating user identity in a federated identity system, (user authentication as a service). |
| Interactive Application | A stand-alone application provided within the exploitation platform for on-line hosted processing. Provides an interactive interface through which the user is able to conduct their analysis of the data, producing <i>Analysis Results</i> as output. Interactive Applications include at least the following types: console application, web application (rich browser interface), remote desktop to a hosted VM. |
| Interactive Console Application | A simple <i>Interactive Application</i> for analysis in which a console interface to a platform-hosted terminal is provided to the user. The console interface can be provided through the user's browser session or through a remote SSH connection. |
| Interactive Remote Desktop | An Interactive Application for analysis provided as a remote desktop session to an OS-session (or directly to a 'native' application) on the exploitation platform. The user will have access to a number of applications within the hosted OS. The remote desktop session is provided through the user's web browser. |
| Interactive Web Application | An Interactive Application for analysis provided as a rich user interface through the user's web browser. |
| Key-Value Pair | A key-value pair (KVP) is an abstract data type that includes a group of key identifiers and a set of associated values. Key-value pairs are frequently used in lookup tables, hash tables and configuration files. |
| Kubernetes (K8s) | Container orchestration system for automating application deployment, scaling and management. |

| Term | Meaning |
|------------------------------|---|
| Login Service | An encapsulation of Authenticated Login provision within the Exploitation Platform context. The Login Service is an OpenID Connect Provider that is used purely for authentication. It acts as a Relying Party in flows with external IdPs to obtain access to the user's identity. |
| EO Network of Resources | The coordinated collection of European EO resources (platforms, data sources, etc.). |
| Object Store | A computer data storage architecture that manages data as objects. Each object typically includes the data itself, a variable amount of metadata, and a globally unique identifier. |
| On-demand Processing Service | A <i>Processing Service</i> whose execution is initiated directly by the user on an ad-hoc basis. |
| Platform (EP) | An on-line collection of products, services and tools for exploitation of EO data |
| Platform Tier | The Platform Tier represents the Exploitation Platform and the services it offers to end-users |
| Processing | A set of pre-defined activities that interact to achieve a result. For the exploitation platform, comprises on-line processing to derive data products from input data, conducted by a hosted processing service execution. |
| Processing Result | The <i>Products</i> produced as output of a <i>Processing Service</i> execution. |
| Processing Service | A non-interactive data processing that has a well-defined set of input data types, input parameterisation, producing <i>Processing Results</i> with a well-defined output data type. |
| Products | EO data (commercial and non-commercial) and Value-added products and made available through the EP. <i>It is assumed that the Hosting Environment for the EP makes available an existing supply of EO Data</i> |
| Resource | A entity, such as a Product, Processing Service or Interactive Application, which is of interest to a user, is indexed in a catalogue and can be returned as a single meaningful search result |
| Resource Tier | The Resource Tier represents the hosting infrastructure and provides the EO data, storage and compute upon which the exploitation platform is deployed |
| Reusable Research Object | An encapsulation of some research/analysis that describes all aspects required to reproduce the analysis, including data used, processing performed etc. |
| Scientific Researcher | Expert user with the objective to perform scientific research. Having minimal IT knowledge with no desire to acquire it, they want the effort for the translation of their algorithm into a service/product to be minimised by the platform. |

| Term | Meaning |
|--|--|
| Service Developer | Expert user with the objective to provide a performing, stable and reliable service/product. Having deeper IT knowledge or a willingness to acquire it, they require deeper access to the platform IT functionalities for optimisation of their algorithm. |
| Software | The compilation of code into a binary program to be executed within the platform on-line computing environment. |
| Systematic Processing Service | A <i>Processing Service</i> whose execution is initiated automatically (on behalf of a user), either according to a schedule (routine) or triggered by an event (e.g. arrival of new data). |
| Terms & Conditions (T&Cs) | The obligations that the user agrees to abide by in regard of usage of products/services of the platform. T&Cs are set by the provider of each product/service. |
| Transactional Web Processing Service (WPS-T) | Transactional extension to WPS that allows adhoc deployment / undeployment of user-provided processors. |
| User | An individual using the EP, of any type (Admin/Consumer/Expert/Guest) |
| Value-added products | Products generated from processing services of the EP (or external processing) and made available through the EP. This includes products uploaded to the EP by users and published for collaborative consumption |
| Visualisation | To obtain a visual representation of any data/products held within the platform - presented to the user within their web browser session. |
| Web Coverage Service (WCS) | OGC standard that provides an open specification for sharing raster datasets on the web. |
| Web Coverage Processing Service (WCPS) | OGC standard that defines a protocol-independent language for the extraction, processing, and analysis of multi-dimensional coverages representing sensor, image, or statistics data. |
| Web Feature Service (WFS) | OGC standard that makes geographic feature data (vector geospatial datasets) available on the web. |
| Web Map Service (WMS) | OGC standard that provides a simple HTTP interface for requesting geo-registered map images from one or more distributed geospatial databases. |
| Web Map Tile Service (WMTS) | OGC standard that provides a simple HTTP interface for requesting map tiles of spatially referenced data using the images with predefined content, extent, and resolution. |
| Web Processing Services (WPS) | OGC standard that defines how a client can request the execution of a process, and how the output from the process is handled. |
| Workspace | A user-scoped 'container' in the EP, in which each user maintains their own links to resources (products and services) that have been collected by a user during their usage of the EP. The workspace acts as the hub for a user's exploitation activities within the EP |

1.5. Glossary

The following acronyms and abbreviations have been used in this report.

| Term | Definition |
|----------|---|
| AAI | Authentication & Authorization Infrastructure |
| ABAC | Attribute Based Access Control |
| ADES | Application Deployment and Execution Service |
| ALFA | Abbreviated Language For Authorization |
| AOI | Area of Interest |
| API | Application Programming Interface |
| CMS | Content Management System |
| CWL | Common Workflow Language |
| DAL | Data Access Library |
| EMS | Execution Management Service |
| EO | Earth Observation |
| EP | Exploitation Platform |
| FUSE | Filesystem in Userspace |
| GeoXACML | Geo-specific extension to the XACML Policy Language |
| IAM | Identity and Access Management |
| IdP | Identity Provider |
| JSON | JavaScript Object Notation |
| K8s | Kubernetes |
| KVP | Key-value Pair |
| M2M | Machine-to-machine |
| OGC | Open Geospatial Consortium |
| PDE | Processor Development Environment |
| PDP | Policy Decision Point |
| PEP | Policy Enforcement Point |
| PIP | Policy Information Point |
| RBAC | Role Based Access Control |
| REST | Representational State Transfer |
| SSH | Secure Shell |
| TOI | Time of Interest |
| UMA | User-Managed Access |

| Term | Definition |
|-------------|---|
| VNC | Virtual Network Computing |
| WCS | Web Coverage Service |
| WCPS | Web Coverage Processing Service |
| WFS | Web Feature Service |
| WMS | Web Map Service |
| WMTS | Web Map Tile Service |
| WPS | Web Processing Service |
| WPS-T | Transactional Web Processing Service |
| XACML | eXtensible Access Control Markup Language |

Chapter 2. Overview

2.1. Building Block Overview

Content Description

This section contains:

- High-Level Description of the Building Block
- Context within EOEPKA

In order to support the Billing Service, the User Profile building block allows to identify users (leaving a reference to their home IdP), to assign them Billing Identities, Service API keys, License keys and to record Terms and Conditions acceptance. It's a persistence service with interfaces that will be queried by other building blocks (License Manager, Billing Service, Policy Decision Point) and modified by both the License Manager and the Login Service (during creation of a new user profile or assignment of new Licenses).

The figure below, identifies the main workflows on which the User Profile participates, along with it's components:

Based on this workflows, the User Profile enables the following functionality aspects

2.1.1. OIDC Client in User Profile

The User Profile will mainly use the OIDC Client functionality in the User Profile Portal in order to provide Client authentication and End-User authentication functionality according to the OpenIDConnect Authentication Code Flow.

This functionality is provided by a custom script to manage the oauth standard and uses the python WellKnownHandler library that allows for simple parsing and usage of an SSO server's "well-known" endpoints.

2.1.2. Send confirmation Email

This functionality allows you to send an email and notify the user that the account will be deleted. In addition, by clicking on the link in the email the user will confirm the action. This functionality is provided by smtp standards for gluu and custom scripts.

The code within the SMTP is dedicated to prepare both the url to proceed with the account removal and the html that will be in the body of the email.

With this it will make the whole process of creating the SMTP Server connection, generating the message and finally sends the email. Previously we need to have configured the mail that will send the email, choosing the mail (Google Account) and the password to access, which are in the Dockerfile as a container variable.

2.1.3. Account removal

The functionality related to the account removal is implemented thanks to a SCIM Client that allow querying for user information, update User Profiles based on the assignment of a specific license or in this case a account removal previously created and the two previously mentioned functionalities.

2.1.4. API Keys List

It's a feature that allows the user to modify their own list of API keys. It is implemented using the SCIM Client that allows to perform attribute modifications and checks against the Login Service OIDC Auth.

2.1.5. Licenses List

It's a feature that allows the user to modify their own list of Licenses the same way the API Keys List above is defined. It is implemented using the SCIM Client that allows to perform attribute modifications and checks against the Login Service OIDC Auth.

2.1.6. List of Terms and Conditions

It's a feature that allows the user to modify their own list of Documents of T&C the same way the API Keys List and Licenses manager above is defined. It is implemented using the SCIM Client that allows to perform attribute modifications and checks against the Login Service OIDC Auth.

2.1.7. Storage Details

This section defines a list of Object Storage bucket URI where the Storage Details of each User are saved. This attribute is multi-valued within Gluu and it's represented as a list, the same way the others attributes are saved, it will use the SCIM Client in order to perform those modifications. It also makes use of the OAuth Client to resolve authentication, but in a different way than the previous attribute editors: since this information will only be accesible by operators, the OAuth Client will check if the attribute isOperator is set to True for the user that want access to the Storage Details front page.

2.2. Static Architecture

Content Description

This section contains:

- Diagram and description of the major logical components within the Building Block

The User Profile, heavily relies on Free and Open Source Software that already implements the interfaces and functionality required. The following image depicts the Static Architecture of this Building Block.

- The Authentication and Authorization Service enables both OIDC and UMA flows for the whole Platform
- The User Profile Portal with SCIM Implementation, allowing direct interaction with the End-User Back-End, in this case, the account removal
- A connection to an SMTP Email server for sending confirmation emails, using at the moment a Google Account.

The Section for the Building Block Design [Design](#) contains detailed descriptions and references to the Open Source components used in this Building Block.

2.3. Use Cases

Content Description

This section contains:

- Diagrams and definition of the use cases covered by this Building Block

2.3.1. USP-UC-001: Use Case: Account Removal

The user is capable deleting their own account

- Principal actor: User
- Preconditions:
 - The user must be signed in to perform the action
- Postconditions:
 - The user's account will be removed
- Main successful scenario:
 - The user logs in to the platform
 - The user selects the option to remove account
 - The user will receive a confirmation email
 - When the user clicks on the url in the email will confirm the action of account removal

This diagram covers the following use cases:

2.3.2. USP-UC-002: Profile Management

The user is capable of modifying their own profile attributes

- Principal actor: User
- Preconditions:
 - The user must be signed in to perform the action
- Postconditions:
 - The user's attributes are modified
- Main successful scenario:
 - The user logs in to the platform
 - The user selects the option for profile management
 - The user can edit attribute fields
 - The changes are saved within the Login Service

2.3.3. USP-UC-003: Licenses Management

The user is capable of managing their own licenses

- Principal actor: User
- Preconditions:
 - The user must be signed in to perform the action
- Postconditions:
 - The user's licenses are available

- Main successful scenario:
 - The user logs in to the platform
 - The user selects the option for licenses
 - The user can view, add and delete licenses
 - The changes are saved within the Login Service

2.3.4. USP-UC-004: API Keys Management

The user is capable of managing their own API keys

- Principal actor: User
- Preconditions:
 - The user must be signed in to perform the action
- Postconditions:
 - The user's API keys are available
- Main successful scenario:
 - The user logs in to the platform
 - The user selects the option for API keys
 - The user can view, add and delete API keys
 - The changes are saved within the Login Service

2.3.5. USP-UC-005: Terms & Conditions Management

The user is capable of managing their own T&C

- Principal actor: User
- Preconditions:
 - The user must be signed in to perform the action
- Postconditions:
 - The user's T&C are available
- Main successful scenario:
 - The user logs in to the platform
 - The user selects the option for Terms & Conditions
 - The user can view, add and delete T&C values
 - The changes are saved within the Login Service

2.4. External Interfaces

Content Description

This section contains:

- Listing of technical external interfaces (with other Building Blocks)

2.4.1. um-login-service Interface

- Identity Management Interface: The User Profile uses a System for Cross Domain Identity (SCIM) Interface through a .well-known URI that describes all standard endpoints provided by um-login-service building block.
- Authentication (AuthN) Interface: The User Profile uses an OpenID Connect interface through a .well-known URI that describes all standard endpoints provided by um-login-service building block.

2.4.2. Web Interface

A web service is made available for users to perform actions related to the building block, such as account removal.

2.4.3. SMTP Interface

The User Profile building block uses SMTP client in order to implement all the functionality related to sending confirmation emails.

- How to configure the account for sending emails
 - If you want to select the email you want to use to send these emails you must update the Dockerfile, changing the values of the variables EMAIL_ADRESS for the account you want to use and EMAIL_PASSWORD for the account password. Note that the value for EMAIL_PASSWORD should be an app password to make it easy and avoid problems (<https://support.google.com/accounts/answer/185833?hl=en>)

2.5. Required Resources

Content Description

This section contains:

- List of HW and SW required resources for the correct functioning of the building Block
- References to open repositories (when applicable)

2.5.1. Software

The following Open-Source Software is required to support the deployment and integration of the Login Service:

- Authentication and Authorization Service

- OAuth - Gluu Inc. (<https://github.com/GluuFederation/oauth>)
- SSO server's "well-known" endpoints
 - Python library: WellKnownHandler (<https://pypi.org/project/WellKnownHandler/>)
- Email Service
 - SMTP Client python library: smtplib (<https://docs.python.org/3/library/smtplib.html>)
 - Email settings library: email (<https://docs.python.org/3/library/email.html#module-email>)
- Deployment, Configuration and Integration Tooling
 - Kubernetes secret and config Tooling (<https://github.com/kubernetes/kubernetes>)

Chapter 3. Building Block Design

Content Description

This section contains:

- A concise breakdown of the Building Block in several independent services (when applicable). For each component, the following subsections are added:
 - Overview and purpose: indicating the functionality covered by the component
 - SW Reuse and Dependencies: indicating reuse of third party open source solutions (if any) and any pre-required Dependencies
 - Interfaces: both internal to the building block and those exposed externally
 - Data: Data usage of the building block, data flow and any GDPR concerns should be addressed here
 - Applicable Resources: links and references to (Reference Docs), and repositories.

When a breakdown is necessary, a general overview of the building block can be given. On the contrary, no breakdown indicates a single component development with the same expected sections.

3.1. General UML design

3.2. Web Service

3.2.1. Overview and Purpose

The web service is the user interface for all other components on this module.

This same web service holds an interface for user attributes edition and profile removal for a user.

3.2.2. Software Reuse and Dependencies

All requirements for the executing of the web service are found under `src/requirements.txt`, and expect Python 3.6.9 or greater to work.

The most important are:

- **EOEPCA-SCIM**: Used to auto-register itself as a client to the Auth. Server upon startup
- **WellKnownHandler**: Used to dynamically check the configuration of the Authorization Server on each execution. For example, it can get the needed endpoints for any API the Web Service needs, like the SCIM endpoints.
- **Flask**: External to EOEPCA's project, this library allows the Web Service to handle HTTP requests, to act as a web server.

3.2.3. Interfaces

3.2.3.1. Oauth Callback

A callback for all oauth actions (login/logout), configurable via the `WEB_config.json` file in case the deployment of the module is unitary, otherwise it will retrieve the environment variables within the system deployment.

This endpoint manages the information given by the auth server, returned from the Login Service, and allows users to log into the app through the SSO's sessions.

3.2.3.2. Email Confirmation

`<base_uri> + /confirmation_mail`

A callback endpoint for all confirmation emails. It receives a code generated for the email, and verifies the action that the user wanted to take.

Currently it only handles account removal, but this can be expanded in the future since the token checking procedure is very generic.

3.2.4. Data

3.2.4.1. Configuration

The Web service gets all its configuration from the file located under `src/config/WEB_config.json`.

The parameters that are accepted, and their meaning, are as follows:

- **sso_url**: hostname or IP of the Auth Server.
- **title**: Title that will be seen when navigating to the web interface
- **scopes**: Scopes used for the internal OAUTH client. Currently, the required are: "openid", "email" and "user_name"
- **client_id**: Client ID used for the internal OAUTH client.
- **client_secret**: Client secret for the corresponding client_id.

- **redirect_uri**: Redirect URI configured in the client, which should point to this service's callback URL.
- **post_logout_redirect_uri**: Redirect URI for post logout of a user.
- **base_uri**: Base URI for all requests against the web server
- **oauth_callback_path**: Callback path for the end of a succesful oauth flow.
- **logout_endpoint**: Endpoint for the logout of a currently logged in user.
- **service_host**: Host to listen on (localhost, 0.0.0.0, etc..)
- **service_port**: Port to listen on for the web server
- **protected_attributes**: Attributes that the user can see about their profiles, but not edit
- **blacklist_attributes**: Attributes that the user can not see or edit.
- **separator_ui_attributes**: Separator used for multi-level attributes
- **color_web_background**: Color used for the background of the web, in HEX.
- **color_web_header**: Color used for the header of the web, in HEX.
- **logo_alt_name**: Alternative name for logo of the web
- **logo_image_path**: Path to logo of the web
- **color_header_table**: Color used for the header of any table
- **color_text_header_table**: Color used for the content of any table
- **color_button_modify**: Color used for the modify button
- **use_threads**: Toggle threads for requests. Enabling this in production is recommended
- **debug_mode**: Toggle debug mode, which enables a debug web interface, more errors and logs.

3.2.5. Applicable Resources

- EOEPKA's SCIM Client - <https://github.com/EOEPKA/um-common-scim-client>
- EOEPKA's Well Known Handler - <https://github.com/EOEPKA/well-known-handler>
- Flask - <https://github.com/pallets/flask>

3.3. SMTP Client

3.3.1. Overview and Purpose

The SMTP Client incorporated with this module serves as a basic mean of sending emails to the user. Currently, the only email configured to be sent is the registration confirmation, but this can be expanded in the future.

3.3.2. Software Reuse and Dependencies

- **smtplib + email**: Basic python libraries which provide a communication layer to an SMTP server

3.3.3. Interfaces

No interfaces are provided for this component, since it's integrated as part of the code of the web, as a python client.

3.3.4. Data

3.3.4.1. Configuration

The following configuration is extracted from ENV variables upon start:

- **EMAIL_ADRESS:** Email used to send the email
- **EMAIL_PASSWORD:** Password for the respective email address.

The following are constants hardcoded in code, but easily changable, and will be variables in the future:

- **host:** SMTP server to communicate to. Default is 'smtp.gmail.com'
- **port:** SMTP port to connect to. Default is '465'

Additionally, the client will work with the system's trusted CA certificates, in order to provide certification validation and all other SSL-related capabilities.

3.3.4.2. Data flow

The SMTP Client doesn't use any data supplied by the user, and thus no data flow is needed. Everything it handles is composed of random tokens, which it sends to the user's email (obtained during login).

3.3.5. Applicable Resources

- smtplib - <https://docs.python.org/3/library/smtplib.html>

3.4. Logging

3.4.1. Design

Logging across the EOEPKA Building Blocks works much in the same way, by usage of a log helper class to initiate a Python logger, handler and formatter that simultaneously outputs log messages to console and a log file. These log files are set on a rotation, with a 1GB limit per each, with the 10 latest log files being kept in memory.

A new configuration yaml file is added to the building block, containing initialization parameters.

3.4.2. Log message format

INFO level log messages follow the following format:

- **TIME:** in ISO 8601 format, "%Y-%m-%dT%H:%M:%S%z"

- LEVELNAME: INFO by default
- COMPONENT: "USP"
- SUBCOMPONENT: N/A
- ACTION IDENTIFIER: HTTP by default
- ACTION TYPE: N/A
- LOG CODE: Unique code identifying log message type
- ACTIVITY: Detailed log message, check reference table

3.4.3. Log message codes

Table 2. Log Codes

| Log Code | Structure |
|----------|---|
| 1001 | {"User":user,"Description":"User login failed"} |
| 1002 | {"User":user,"Description":"User sucessfully logs in"} |
| 1003 | {"User":user,"Description":"User updated profile"} |
| 1004 | {"User":user,"Description":"User updated T&C"} |
| 1005 | {"User":user,"Description":"User updated API Keys"} |
| 1006 | {"User":user,"Description":"User updated Storage details"} |
| 1007 | {"User":user,"Description":"User updated Licenses"} |
| 1008 | {"User":user,"Description":"User deleted profile"} |
| 1009 | {"User":user,"Description":"Error reading token"} |
| 1010 | {"User":user,"Description":"Error fetching user info","Token":access_token} |

Chapter 4. User Story Traceability

Table 3. User Stories

| User Story Code | Description | Building Block Use Case | Master Use Case |
|-----------------|--|-------------------------|-----------------|
| EOEPCA-165 | T&C Review Section | USP-UC-005 | EOEPCA-UC-1506 |
| EOEPCA-161 | License Management Section | USP-UC-003 | EOEPCA-UC-1506 |
| EOEPCA-13 | Reusable SCIM Client Implementation | - | EOEPCA-UC-1003 |
| EOEPCA-11 | Reusable OIDC Client Implementation | - | EOEPCA-UC-1003 |
| EOEPCA-88 | Extend SCIM Client with UMA Protection | - | EOEPCA-UC-1003 |
| EOEPCA-211 | Implementation of Helm Charts | - | CI/CD Task |
| EOEPCA-87 | Email Notifications Hook | USP-UC-001 | EOEPCA-UC-0110 |
| EOEPCA-66 | Setup of CI/CD Configuration | - | CI/CD Task |
| EOEPCA-24 | On-boarding Flow | - | CI/CD Task |
| EOEPCA-21 | End-User Account Removal | USP-UC-001 | EOEPCA-UC-0110 |
| EOEPCA-20 | End-User Profile Edition/Update | USP-UC-002 | EOEPCA-UC-0112 |
| EOEPCA-164 | API Keys Management Section | USP-UC-004 | EOEPCA-UC-1506 |
